

Data cube: a relational
aggregation operator
generalizing group-by,
cross-tab, and sub-totals

Advanced Topics in Databases

Outline

- Reminding:
 - Relational Aggregate Operators
 - Relational GROUP BY Operator
- Problems with GROUP BY
 - Histograms
 - Roll-Up Reports
 - Cross-Tabs
- CUBE Operator
 - Think of the N-dimensional Cube
 - An Example
 - Syntax
 - Functional Aggregation
 - Computing the Cube

Relational Aggregate Operators

- SQL has several aggregate operators:
 - SUM(), MIN(), MAX(), COUNT(), AVG()
 - Some systems extend this with many other:
 - Stat functions, financial functions...
 - i.e. RANK(), N_TILE(), RATIO_TO_TOTAL()
- The basic idea is:
 - Combine all values in a column into a scalar value
- Syntax
 - `SELECT AVG(Temp)`
`FROM Weather;`

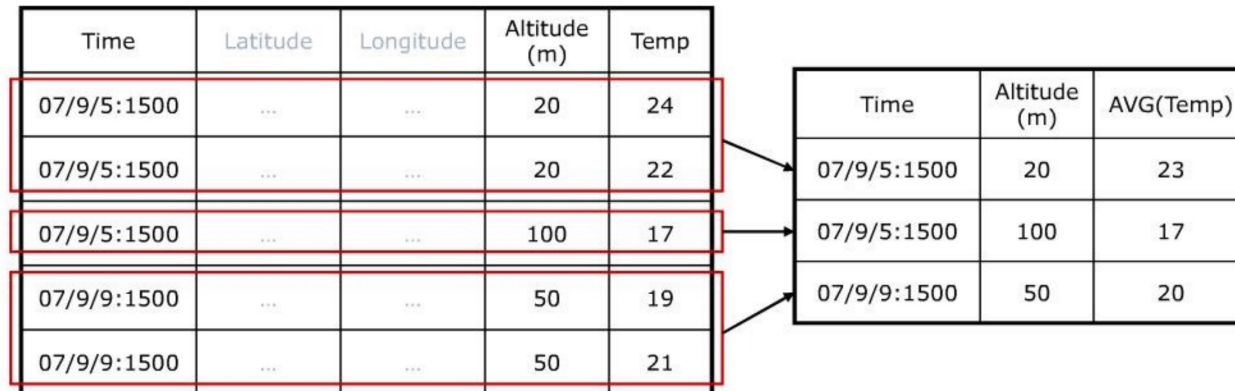

Relational GROUP BY Operator

- Aggregation functions return a single value.
- Using the GROUP BY operator SQL can create a table with several tuples indexed by a set of attributes.
- Example:

```
■ SELECT Time, Altitude, AVG(Temp)
   FROM Weather
  GROUP BY Time, Altitude;
```

| Time | Latitude | Longitude | Altitude (m) | Temp |
|-------------|----------|-----------|--------------|------|
| 07/9/5:1500 | ... | ... | 20 | 24 |
| 07/9/5:1500 | ... | ... | 20 | 22 |
| 07/9/5:1500 | ... | ... | 100 | 17 |
| 07/9/9:1500 | ... | ... | 50 | 19 |
| 07/9/9:1500 | ... | ... | 50 | 21 |

| Time | Altitude (m) | AVG(Temp) |
|-------------|--------------|-----------|
| 07/9/5:1500 | 20 | 23 |
| 07/9/5:1500 | 100 | 17 |
| 07/9/9:1500 | 50 | 20 |

Problems with GROUP BY - Histograms

- Users want histograms
 - Suppose:
 - Day(): time → day
 - Nation(): latitude & longitude → name of country

```
SELECT    day, nation, MAX(Temp)
FROM      weather
GROUP BY  Day(Time) AS day,
          Nation(Latitude, Longitude) AS nation;
```

Problems with GROUP BY - Histograms

- The following is not a STANDARD SQL query!

```
■ SELECT    day, nation, MAX(Temp)
   FROM      weather
   GROUP BY  Day(Time) AS day,
             Nation(Latitude, Longitude) AS nation;
```

- In standard SQL:

```
■ SELECT    day, nation, MAX(Temp)
   FROM      (SELECT Day(Time) AS day,
                   Nation(Latitude, Longitude) AS nation,
                   FROM weather) AS foo
   GROUP BY  day, nation;
```

Problems with GROUP BY – Roll-Up Reports

- Users want roll-Up reports

- Attributes: Model, Year, Color, and, Sales

- Chevy Sales Roll Up by Model by Year by Color:

| | | | | <div>□</div> Keyword ALL | | | |
|-------|------|-------|--|---------------------------------|-------|-------|-------|
| | | | | <div>■</div> {Black, White} | | | |
| | | | | <div>■</div> {1994, 1995} | | | |
| | | | Sales by Model by Year by Color | Sales by Model | Sales | | |
| Model | Year | Color | | Model | Year | Color | Units |
| Chevy | 1994 | Black | 50 | Chevy | 1994 | Black | 50 |
| | | White | 40 | Chevy | 1994 | White | 40 |
| | 1995 | ALL | | Chevy | 1994 | ALL | 90 |
| | | Black | 85 | Chevy | 1995 | Black | 85 |
| | | White | 115 | Chevy | 1995 | White | 115 |
| | | ALL | | Chevy | 1995 | ALL | 200 |
| | | Chevy | ALL | ALL | 290 | | |

Problems with GROUP BY – Roll-Up Reports

- To build the “Chevy Sales Roll Up”

```
SELECT 'ALL', 'ALL', 'ALL', SUM(Sales)
  FROM Sales
 WHERE Model = 'Chevy'
UNION
SELECT Model, 'ALL', 'ALL', SUM(Sales)
  FROM Sales
 WHERE Model = 'Chevy'
 GROUP BY Model
UNION
SELECT Model, Year, 'ALL', SUM(Sales)
  FROM Sales
 WHERE Model = 'Chevy'
 GROUP BY Model, Year
UNION
SELECT Model, Year, Color, SUM(Sales)
  FROM Sales
 WHERE Model = 'Chevy'
 GROUP BY Model, Year, Color;
```

| Model | Year | Color | Units |
|-------|------|-------|-------|
| Chevy | 1994 | Black | 50 |
| Chevy | 1994 | White | 40 |
| Chevy | 1994 | ALL | 90 |
| Chevy | 1995 | Black | 85 |
| Chevy | 1995 | White | 115 |
| Chevy | 1995 | ALL | 200 |
| Chevy | ALL | ALL | 290 |

Too many
GROUP BYs and **UNIONS!!**

Problems with GROUP BY – Cross-Tab

- Users want Cross-Tabulations

■ Chevy Sales Cross-Tab

| Chevy | 1994 | 1995 | Total (ALL) |
|-------------|------|------|-------------|
| Black | 50 | 85 | 135 |
| White | 40 | 115 | 155 |
| Total (ALL) | 90 | 200 | 290 |

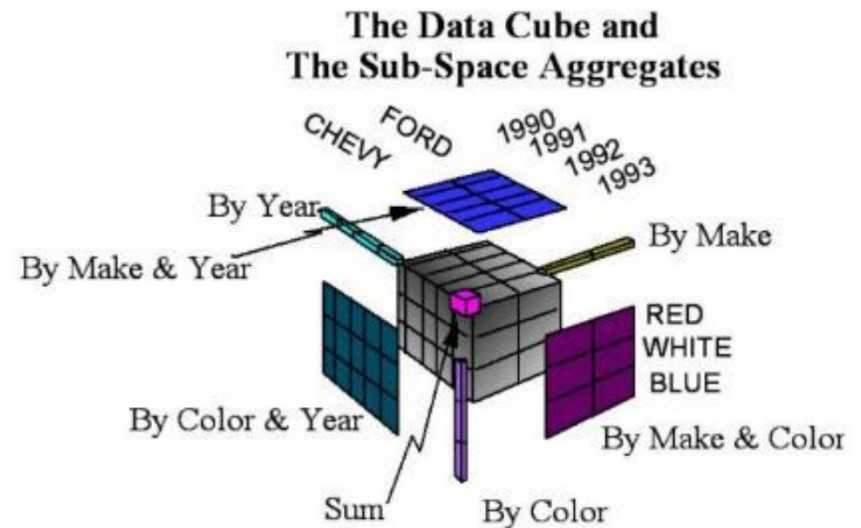

■ By adding the following clause

```
UNION
SELECT Model, 'ALL', Color, SUM(Sales)
FROM Sales
WHERE Model = 'Chevy'
GROUP BY Model, Color;
```

| Model | Year | Color | Units |
|-------|------|-------|-------|
| Chevy | 1994 | Black | 50 |
| Chevy | 1994 | White | 40 |
| Chevy | 1994 | ALL | 90 |
| Chevy | 1995 | Black | 85 |
| Chevy | 1995 | White | 115 |
| Chevy | 1995 | ALL | 200 |
| Chevy | ALL | ALL | 290 |
| Chevy | ALL | Black | 135 |
| Chevy | ALL | White | 155 |

CUBE Operator

- Problems with GROUP BY
 - GROUP BY cannot directly construct:
 - Histograms
 - Roll-Up reports
 - Cross-Tabs
- CUBE Operator
 - Generalize GROUP BY and ROLL-UP and Cross-Tabs.

CUBE Operator

- Think of the N-dimensional Cube
- N-dimensional Aggregate [sum(), max(), ...]
 - Fits relational model exactly:
 - $a_1, a_2, \dots, a_n, f()$
- Super-aggregate over N-1 dimensional sub-cubes
 - ALL, $a_2, \dots, a_n, f()$
 - $a_1, \text{ALL}, a_3, \dots, a_n, f()$
 - ...
 - $a_1, a_2, \dots, \text{ALL}, f()$
 - This is the N-1 dimensional cross-tab.
- Super-aggregate over N-2 dimensional sub-cubes
 - ALL, ALL, $a_3, \dots, a_n, f()$
 - ...
 - $a_1, a_2, \dots, \text{ALL}, \text{ALL}, f()$
- ...

CUBE Operator – An example

| SALES | | | |
|-------|------|-------|-------|
| Model | Year | Color | Sales |
| Chevy | 1990 | red | 5 |
| Chevy | 1990 | white | 87 |
| Chevy | 1990 | blue | 62 |
| Chevy | 1991 | red | 54 |
| Chevy | 1991 | white | 95 |
| Chevy | 1991 | blue | 49 |
| Chevy | 1992 | red | 31 |
| Chevy | 1992 | white | 54 |
| Chevy | 1992 | blue | 71 |
| Ford | 1990 | red | 64 |
| Ford | 1990 | white | 62 |
| Ford | 1990 | blue | 63 |
| Ford | 1991 | red | 52 |
| Ford | 1991 | white | 9 |
| Ford | 1991 | blue | 55 |
| Ford | 1992 | red | 27 |
| Ford | 1992 | white | 62 |
| Ford | 1992 | blue | 39 |

| DATA CUBE | | | |
|-----------|------|-------|-------|
| Model | Year | Color | Sales |
| ALL | ALL | ALL | 942 |
| chevy | ALL | ALL | 510 |
| ford | ALL | ALL | 432 |
| ALL | 1990 | ALL | 343 |
| ALL | 1991 | ALL | 314 |
| ALL | 1992 | ALL | 285 |
| ALL | ALL | red | 165 |
| ALL | ALL | white | 273 |
| ALL | ALL | blue | 339 |
| chevy | 1990 | ALL | 154 |
| chevy | 1991 | ALL | 199 |
| chevy | 1992 | ALL | 157 |
| ford | 1990 | ALL | 189 |
| ford | 1991 | ALL | 116 |
| ford | 1992 | ALL | 128 |
| chevy | ALL | red | 91 |
| chevy | ALL | white | 236 |
| chevy | ALL | blue | 183 |
| ford | ALL | red | 144 |
| ford | ALL | white | 133 |
| ford | ALL | blue | 156 |
| ALL | 1990 | red | 69 |
| ALL | 1990 | white | 149 |
| ALL | 1990 | blue | 125 |
| ALL | 1991 | red | 107 |
| ALL | 1991 | white | 104 |
| ALL | 1991 | blue | 104 |
| ALL | 1992 | red | 59 |
| ALL | 1992 | white | 116 |
| ALL | 1992 | blue | 110 |

- Think of ALL as a token representing the set:

- {red, white, blue}
- {1990, 1991, 1992}
- {Chevy, Ford}

CUBE Operator – Syntax

- Proposed syntax example:

- SELECT Model, Make, Year, SUM(Sales)
FROM Sales
WHERE Model IN {"Chevy", "Ford"}
AND Year BETWEEN 1990 AND 1994
GROUP BY **CUBE** Model, Make, Year
HAVING SUM(Sales) > 0;
- Note: GROUP BY operator repeats aggregate list
 - in select list
 - in group by list

CUBE Operator – Functional Aggregation

- Allows functional aggregations (e.g., Sales by quarter):
 - ```
SELECT Store, quarter, SUM(Sales)
FROM Sales
WHERE nation="Korea" AND Year=1994
GROUP BY ROLLUP Store, Quarter(Date) AS quarter;
```
- ROLLUP Operator
  - A Subset of CUBE Operator
  - Return "Sales Roll Up by Store by Quarter" in 1994.
